

PERMANENT FENCING SYSTEM FOR NEWTS, OTHER AMPHIBIANS AND REPTILES.

Material: Recycled HDPE Plastic

Location: attached on the outside edge of the cycling circuit barrier fencing.

Description: 50mm return folded and welded into the top edge forming an overlap to emulate the 'rolled top curl'. There is also a scored groove 100mm from the bottom of the panel to allow the installer to create an underground return, if required. Each panel also incorporates 4 expansion slots at one end. These allow for slight expansion in the panels caused by seasonal temperature changes and therefore protects the fixings from breaking.) This material is suited for sites where there is a high level risk of human disturbance.
